

AI Nightstand Agent Mode Add-On

Let your phone think ahead — while you sleep

AI Nightstand already helps your smartphone do useful work while you rest. But with the rise of smart AI agents, you can now unlock even more possibilities.

What's an AI Agent?

AI agents are automated helpers that can think and act on your behalf. They don't just wait for a prompt — they perform smart tasks like organizing your day, summarizing notes, or preparing personalized content automatically.

Night Mode: Private by Default

By default, AI Nightstand runs entirely offline. Using a local LLM, your phone can process tasks like journaling, planning, or summarizing events — all without ever connecting to the internet.

Agent Mode: Online Optional

For more advanced users, enabling occasional internet access allows AI Nightstand to use scheduled scripts and automation tools to:

Retrieve weather, news, or reminders

Sync with your calendar or journal

Draft emails or daily summaries

Prepare content for your day ahead

Privacy-First Design

Whether you stay fully offline or use hybrid access, you're always in control. The system is built around:

Local processing by default

User-defined scripts and permissions

Full visibility into what the AI is doing

Coming Soon

We are working on a full Agent Mode Add-On for both Android and iPhone, including:

Example workflows

Voice control options

Task automation templates

Step-by-step integration with your AI Nightstand setup
